Nirvana

Global Healthcare Ecosystem Platform

THE PROBLEM

1. The global healthcare ecosystem involves multiple stakeholders, services and interactions.
2. Healthcare experiences can become fragmented across different platforms and services.
3. Users need a simpler way to discover, access and interact with healthcare-related services.
4. A connected digital ecosystem can reduce fragmentation and make healthcare interactions easier to manage.
5. Patients run from pharmacy to pharmacy in search of the medicines prescribed by the doctor.
6. People from around the world can travel the world with ease for healthcare.

MY APPROACH

Instead of solving only one healthcare workflow, I approached Nirvana as an ecosystem product designed to connect different healthcare needs and stakeholders through a unified digital experience.

WHAT I BUILT

- Designed the concept around a connected global healthcare ecosystem.
- Focused on creating a unified digital experience rather than isolated healthcare workflows.
- Structured the product to support interactions across different healthcare stakeholders and services.
- Designed the platform with scalability in mind so additional healthcare capabilities can be integrated over time.

IMPACT

> Created a product vision focused on making the global healthcare ecosystem more connected, accessible and easier to navigate through a unified digital platform.

Shadow Analytics

AI-Powered Document Intelligence Platform

View project: https://lnkd.in/p/gP2C4hG5

THE PROBLEM

1. Businesses spend a lot of time reading PDFs, scanned documents, and reports manually.
2. Finding specific information in these files is slow and repetitive.
3. Manual work can lead to mistakes and missed information.
4. As the number of documents grows, it becomes harder to process them quickly and make decisions.

MY APPROACH

Instead of building another generic document reader, I designed the system around the actual decision users need to make. Users can upload documents, define the information they need, and let an AI pipeline extract, validate and structure the required information.

WHAT I BUILT

- Built an end-to-end AI document intelligence platform using Python, OCR/Tesseract, Gemini/LLMs, RAG and structured extraction pipelines.
- Designed the workflow: Upload → OCR → Extraction → Validation → Confidence Scoring → Human Review → Structured Output.
- Added custom questions/fields, allowing users to define what information the AI should extract.
- Added confidence scores and bounding boxes so users can understand and verify where extracted information came from.
- Built filtering, custom columns and Excel export for downstream analysis.
- Designed the platform as a reusable SaaS architecture so the same workflow can support different document types and industries.

IMPACT

> 90–98% extraction accuracy and approximately 85% reduction in manual document-processing effort, turning large volumes of unstructured documents into structured, decision-ready information.

SwingStatsPro

Golf Tournament Scoring & Analytics Platform

View project: https://swing-pro-rose.vercel.app/

THE PROBLEM

1. Golf tournaments often rely on manual score collection and calculation.
2. Golfers may not have a dedicated digital platform to enter their scores and instantly see results.
3. Manual calculation and result consolidation can delay leaderboards and tournament outcomes.
4. Traditional scoring does not provide much visibility into player performance and tournament analytics.

MY APPROACH

I designed the product around the golfer and tournament organizer: make score entry simple, automate tournament calculations, and provide instant results and player insights instead of relying on manual calculations.

WHAT I BUILT

- Built a real-time golf tournament scoring and analytics platform.
- Designed digital score entry for golfers.
- Built the underlying tournament calculation engine to automatically process scores.
- Added real-time leaderboards and tournament results.
- Added player-level performance insights and analytics.
- Designed the platform as a reusable foundation that can support different tournaments and scoring workflows.

IMPACT

> Turned a traditionally manual scoring workflow into a digital, real-time tournament experience where golfers can record scores, automatically calculate results, track leaderboards and analyze performance.

The Wisely App

AI-Powered Personal & Group Finance Platform

View project: https://www.thewiselyapp.com

THE PROBLEM

1. Expense-sharing apps primarily focus on answering “Who owes whom?”
2. People also need to track their own personal expenses, budgets and spending patterns.
3. Personal and group finances are often managed separately, making it difficult to understand the complete financial picture.
4. Users need more than transaction recording — they need insights that help them make better financial decisions.

MY APPROACH

I designed Wisely as a broader alternative to traditional expense-sharing apps by combining personal finance, group expenses, budgeting, analytics and AI insights into one platform.

WHAT I BUILT

- Built a full-stack personal and group finance platform.
- Enabled users to record both personal transactions and shared/group expenses.
- Added expense analysis and spending-pattern insights.
- Built a budget planner to help users plan and monitor spending.
- Added AI-powered financial insights to turn transaction data into actionable information.
- Added features such as Net Position, alerts and QR-based group onboarding.
- Designed the product as a modern web/PWA experience.

IMPACT

> Moved the experience beyond simple expense splitting toward a complete financial picture — helping users understand where their money is going, how they are performing against their budget, and what they could improve.

Digital Car Wash

AI-Enabled Service Verification & Payment Accountability Platform

THE PROBLEM

1. Recurring car-wash services often operate on trust, with customers paying monthly despite occasional missed services.
2. Individual missed washes may seem insignificant, but accumulated missed services can result in thousands of rupees in annual leakage.
3. Customers have no reliable way to verify whether the service provider actually completed the wash.
4. There is also no structured mechanism to differentiate between provider absence, customer/car absence, and completed service.

MY APPROACH

I designed a digital proof-of-service platform that creates a transparent verification layer between customers and service providers, linking service completion, evidence and payment settlement.

WHAT I BUILT

- Designed a platform where car-wash providers submit a live photo at the time of service, preventing the use of previously captured gallery images.
- Built a customer verification workflow to confirm whether the service was actually completed.
- Designed separate workflows for provider absent, customer/car absent and service completed scenarios.
- Enabled customers to assign the service to a trusted alternate person when the original provider is unavailable.
- Designed a carry-forward payment mechanism when a scheduled service is not completed.
- Incorporated service history and payment tracking to provide customers with a transparent record of recurring services.
- Designed an AI layer for vehicle/image verification, duplicate-photo detection and anomaly detection to reduce fraudulent service claims.

IMPACT

> Designed to reduce payment leakage and service disputes by creating verifiable proof of every scheduled wash, while giving customers greater visibility into service delivery and recurring payments.
