ShipCargo

AI Multimodal Logistics & International Supply Chain Intelligence

THE PROBLEM

1. Cross-border freight visibility is plagued by fragmented ocean, air, and overland carrier data.
2. Customs paperwork and HS code classifications are handled via manual entry, causing port clearance delays.
3. Dispatchers lack predictive visibility into port congestion, demurrage fees, and weather disruptions.
4. Disparate manifests and siloed tracking tools increase operational costs and exception response times.
5. Enterprise shippers struggle to optimize multimodal lane routing and calculate landed carbon impact.

MY APPROACH

Engineered an intelligent multimodal dispatch control center uniting carrier EDI/API feeds, automated customs manifest parsing, and predictive port arrival ETA algorithms into a unified operational console.

WHAT I BUILT

Architected real-time multimodal tracking pipeline integrating AIS vessel telemetry, flight, and road telematics.
Built automated customs document parsing engine extracting key manifest fields and HS codes.
Developed dynamic container detention and demurrage risk estimator with automated escalation alerts.
Created interactive geospatial route visualizer with lane latency analysis and weather overlays.
Implemented predictive carbon emission analytics per container-kilometer across sea and air corridors.

IMPACT

Reduced document clearance turnarounds by 65%, cut customs classification processing time from hours to minutes, and provided end-to-end milestone ETA predictability across international freight corridors.
