Digital Car Wash

AI-Enabled Service Verification & Payment Accountability Platform

THE PROBLEM

1. Recurring car-wash services often operate on trust, with customers paying monthly despite occasional missed services.
2. Individual missed washes may seem insignificant, but accumulated missed services can result in thousands of rupees in annual leakage.
3. Customers have no reliable way to verify whether the service provider actually completed the wash.
4. There is also no structured mechanism to differentiate between provider absence, customer/car absence, and completed service.

MY APPROACH

I designed a digital proof-of-service platform that creates a transparent verification layer between customers and service providers, linking service completion, evidence and payment settlement.

WHAT I BUILT

- Designed a platform where car-wash providers submit a live photo at the time of service, preventing the use of previously captured gallery images.
- Built a customer verification workflow to confirm whether the service was actually completed.
- Designed separate workflows for provider absent, customer/car absent and service completed scenarios.
- Enabled customers to assign the service to a trusted alternate person when the original provider is unavailable.
- Designed a carry-forward payment mechanism when a scheduled service is not completed.
- Incorporated service history and payment tracking to provide customers with a transparent record of recurring services.
- Designed an AI layer for vehicle/image verification, duplicate-photo detection and anomaly detection to reduce fraudulent service claims.

IMPACT

> Designed to reduce payment leakage and service disputes by creating verifiable proof of every scheduled wash, while giving customers greater visibility into service delivery and recurring payments.
